

(a) Output-distortion surrogate

(b) Shared-budget allocation

Per-entry bit selection

$$b_i(\lambda) = \arg \min_{b \in \{0, 2, 3, 4, 8, 16\}} [s_i \tilde{\epsilon}(b) + \lambda b]$$

Distortion term Bit cost

λ bisection · parallel choices · discrete repair

Same average budget: 2 bits

Entry i	1	2	3	4	5	6	7	8
Uniform	2	2	2	2	2	2	2	2
Keep / drop	0	0	0	0	16	0	0	0
ODM-KV	0	2	0	3	8	0	3	0

Shared across all layers,
KV heads and tokens

(c) Packed KV cache

2-bit bank

i = 2
